

## Target Audiences and Delivery Methods Explanation:

The audience target for our project is everyone on campus. This includes students, staff, and faculty. Different audiences have different understanding levels and may require different approaches when teaching the topics. Tailoring the information so that it is easy to consume will help all, but adding additional metrics and technical information may help certain departments better than others. Key metrics will be needed for staff members in managerial positions, allowing them to track present and future success of this program along with past information as a baseline control. The approach will change depending on the positions of the individual or the knowledge they have on the topic.

Key risks that come from phishing is the potential of propagating additional, potentially more successful attacks from the victim's email address. These can potentially be used to target key infrastructure within the university and other individuals who have access to critical systems. Human behavior will always be the hardest part of any campaign to correct as only one person needs to fall for these attacks to propagate more. Training to rectify these issues before they happen and prevent future incidents would be a prime course of action.

Each method used in the phishing awareness campaign is effective because it allows us to reach people in multiple ways and helps us reinforce our message through multiple channels. The use of pamphlets, posters, and flyers keep awareness visible throughout campus as quick reminders. The use of training materials and sessions give individuals a deeper understanding of phishing tactics. Campus events help engage the community by encouraging discussion, participation, and demonstrations. Online resources will also be available for students who are remote or partially remote for classes, allowing people to learn and protect themselves at any time.
