

Title: NET-2650 – Log Observation Lab

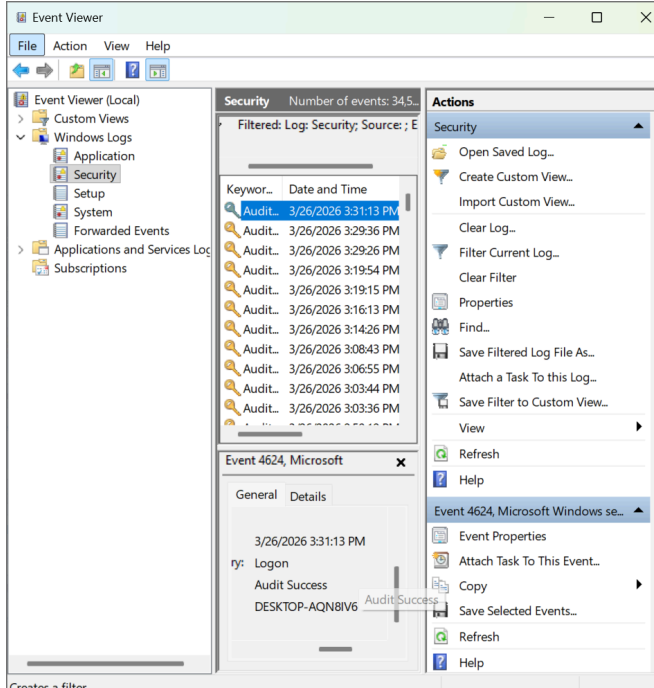

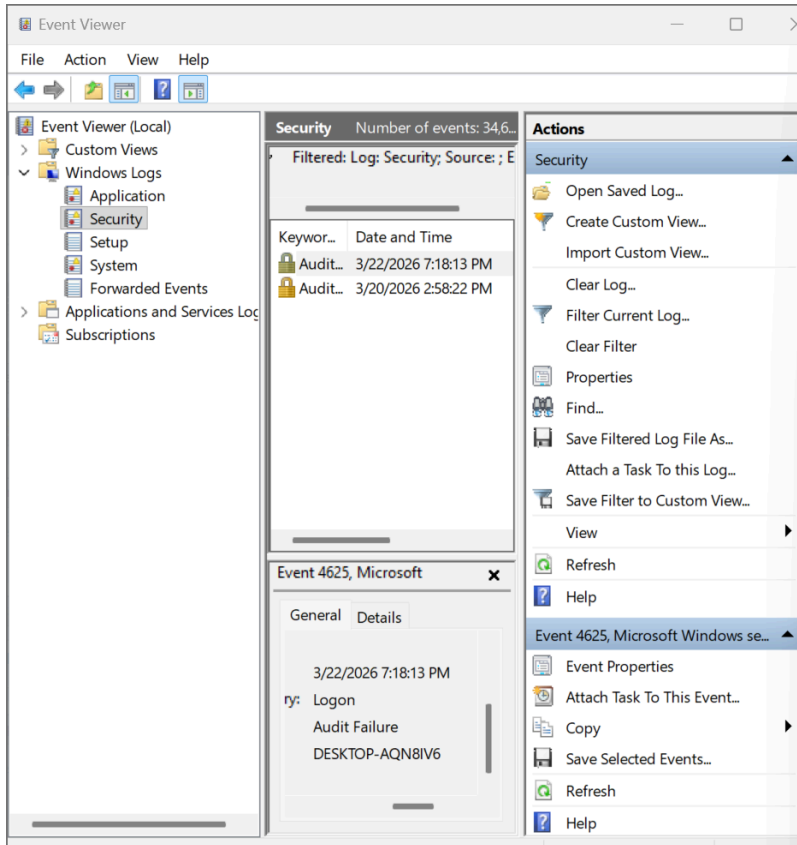

Brylan Williamson

3-26-26

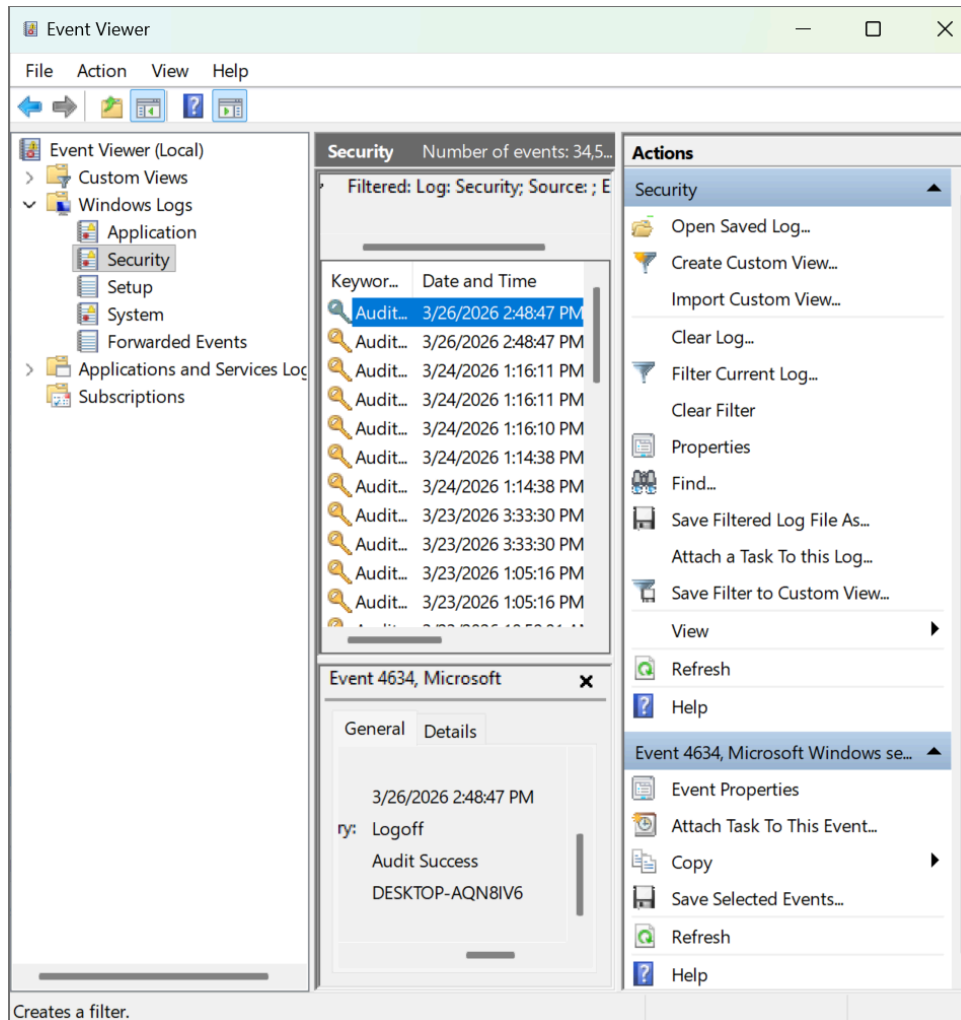

Windows Log Observations

Event	Why Normal/Suspicious	Analyst Action
Event ID 4624 – Successful login on 3/26/2026 at 3:31 PM	This is normal because it shows a successful login from the system during a typical time, which matches expected user behavior.	No immediate action required, continue monitoring for unusual patterns.
Event ID 4634 – Logoff on 3/26/2026 at 2:48 PM	This is normal because it indicates the user logged off properly after a session.	No action needed, this is standard system activity.
Event ID 4625 – Failed login on 3/22/2026 at 7:18 PM	This is suspicious because a failed login attempt may indicate someone entering incorrect credentials or attempting unauthorized access.	Investigate the account, review if there are multiple failed attempts, and monitor for possible brute force activity.
Event ID 4625 – Failed login (additional attempts)	Multiple failed login attempts increase suspicion of a brute force attack or unauthorized access attempt.	Check source of attempts, consider account lockout or password reset, and review system logs for related activity.
