

Windows:

windows_evidence.png

I captured a screenshot showing the system hostname, Windows version, and current date and time. The hostname identifies the specific machine, and the OS version shows what system is being used. The date and time provide a timestamp for when the evidence was collected. This is important for documentation, accuracy, and verifying the work later.

Linux:

linux_evidence.png

I captured a screenshot showing the system hostname, Linux OS information, and current date and time using terminal commands. The hostname identifies the system, and the OS details show the environment being used. The timestamp confirms when the evidence was collected. This is important for maintaining accurate records and supporting reproducibility.
