

**1. Why is defining scope before testing important in professional work?**

Defining scope helps us understand exactly what parts of the website we are responsible for testing. It keeps the work focused and makes sure we follow the project guidelines.

**2. What is one example of something that is intentionally out of scope for this project?**

Fixing or making changes to the website is out of scope since we are only responsible for assessing and reporting issues.

**3. What could go wrong if the scope is not controlled?**

If the scope is not controlled, we might do work we are not allowed to do or miss important tasks. This can lead to confusion, wasted time, and unorganized results.
