

CYBR2100 ROE Outline

Authorization and Consent

Authorization has been formally obtained to conduct **limited security testing** on the specified systems as part of an academic exercise. All testing activities are conducted in accordance with the approved Rules of Engagement and have been reviewed and authorized by all relevant stakeholders.

Testing is strictly confined to the defined scope and must adhere to all ethical, legal, and institutional requirements.

Stop-Test Conditions

Testing activities must be immediately suspended under any of the following conditions:

- Any indication of **production system impact**
- Detection of **unexpected or unstable system behavior**
- Evidence of **unauthorized access to sensitive data**

If a stop-test condition is triggered, all activity must cease immediately, and all stakeholders must be notified without delay.

Scope and Operational Boundaries

All testing must:

- Remain within the **approved scope of systems and assets**
- Avoid any actions that could disrupt normal operations

- Exclude access to or modification of sensitive data unless explicitly authorized

Any deviation from scope requires prior approval from stakeholders.

Evidence and Documentation

The following artifacts support this engagement:

- ROE Document (PDF)
- Week 5 Reflection (PDF)
- Network Architecture Diagram

All testing activities and findings must be documented to ensure transparency, accountability, and traceability.

Reflection

One key trade-off in this engagement was prioritizing **breadth over depth**. While a wider range of assets was assessed, this limited the ability to perform deeper analysis on critical systems.

In future engagements, narrowing the scope would allow for more thorough testing and yield more actionable and meaningful results.

Conclusion

This Rules of Engagement framework ensures that all testing activities are conducted in a controlled, ethical, and responsible manner. By clearly defining authorization, boundaries, and stop conditions, the risk to systems and stakeholders is minimized while maintaining the integrity of the testing process.
